The era when the orthodontic specialist was the sole provider of all orthodontic treatment has passed. Thus, to reduce the severity of many complicated treatment cases, one must take a multidisciplinary approach that involves orthodontic therapy with minor surgery in orthodontics. This book describes the most relevant pathologic, surgical, and periodontal aspects of orthodontic treatment planning.

### Surgical orthodontics-minor surgical procedures

Orthognathic surgery; also known as corrective jaw surgery or simply jaw surgery, is surgery designed to correct conditions of the jaw and face related to structure, growth, sleep apnea, TMJ disorders, malocclusion problems owing to skeletal disharmonies, or other orthodontic problems that cannot be easily treated with braces. Originally coined by Harold Hargis, this surgery is also used to treat congenital conditions such as cleft palate. Typically during oral surgery, bone is cut, moved, modif

Dentoalveolar decompensation which is performed in conventional pre-surgical orthodontics works against the physiological compensatory dentoalveolar processes. In other words, the orthodontist tries to achieve a pre- operative occlusion which is against what the soft tissue and skeletal components dictate.

Surgical Orthodontics . Sometimes jaw discrepancies are quite pronounced - the upper and/or lower jaw(s) may be too large or small and not fit properly with the cranial base - and require orthognathic surgery. This type of surgery corrects skeletal discrepancies in the bony structures of the teeth and jaws.

Jaw surgery, also known as orthognathic (or-thog-NATH-ik) surgery, corrects irregularities of the jaw bones and realigns the jaws and teeth to improve the way they work. Making these corrections may also improve your facial appearance. Jaw surgery may be a corrective option if you have jaw problems that can't be resolved with orthodontics alone.
